Release 1.0.3

Jack Lubin, Maria Vincent, and Eulrika Wu

Jun 25, 2022

CONTENTS:

1	Utils Functions	1
2	Plotting Functions	3
3	Indices and tables	5
	Python Module Index	7
	Index	9

CHAPTER
ONE

UTILS FUNCTIONS

Function to perform utils.

utils.coscalc(planetinfo)

Cosine Angle Calculation

Calculate the angle between earth-planet line and sun-planet line using cosine rules.

Parameters

-planetinfo – Dictionary. The dictionary of ephemeris information from gen_ephem_today

Returns

Listed of values of angle theta in radian

Return type:

list

utils.gen_ephem_today(date)

Ephemeris generator for given date

Generates the equatorial coordinates and distance to a planet as observed from Earth, and its distance to the Sun.

Parameters

date (string) – Date to view the Solar System in YYYY-MM-DD format

Returns

parseData(files)

Return Type:

list

utils.parsedata(filelist, date)

Parse Data

Read and parse the relevant data from the Horizons@JPL (<https://ssd.jpl.nasa.gov/horizons/app.html#/>) curl command

Parameters

filelist (array of strings) – an array where each element is the name of the file pulled from Horizons for the ith planet

Returns

allplanets– A list of dictionaries with each planet's relevant information [RA, DEC, HELRANGE (Sun-Planet distance), EARTH RANGE (Earth-Planet distance)], and each dictionary is stored in this list.

Return Type:

list

CHAPTER TWO

PLOTTING FUNCTIONS

Function to perform plotting.

`plotting.plotAll(allplanets, thetas, truedist=True)`

The main plotting function. Formatted the same each time, this displays the relative positions of all the planets at the user inputted timestamp.

Inputs:

- **allplanets (list of dictionaries) - Each planet gets a dictionary with its relevant information (JD, RA, DEC, RANGE),**
and each dictionary is stored in this list.
- thetas (list of floats) - Each planet's updated RA angle
- **truedist (boolean) - True if you want to see the true relative distances to the planets on the planet.**
False if you want an evenly spaced system,

Outputs:

None

`plotting.plotinner(allplanets, thetas)`

Parameters

- **-allplanets** – List of dictionaries. Each planet gets a dictionary with its relevant information (JD, RA, DEC, RANGE), and each dictionary is stored in this list.
- **-thetas** – List of angles generated using `utils.coscalc`

Returns

None

Return Type:

NoneType

`plotting.plotouter(allplanets, thetas)`

Only plot the outer 5 planets

Parameters

- **-allplanets** – List of dictionaries. Each planet gets a dictionary with its relevant information (JD, RA, DEC, RANGE), and each dictionary is stored in this list.
- **-thetas** – List of angles generated using `utils.coscalc`

Returns

None

Return Type:

NoneType

**CHAPTER
THREE**
